

## Entering the Business Library, you gain access to the most powerful

accounting/business management information system now available for microcomputers. For small to medium sized businesses, this software library is unequivocally the best total resource for productive data processing.

The Business Library is a fully integrated, flexible, comfortable, powerful, and reliable management information system. The seven accounting application volumes were designed by a prominent "big eight" accounting firm. The Word Processor and Proffit Planner volumes were designed to incorporate new, sophisticated features for microcomputing. As a complete system for business information management, it is designed with minicom-

puter-level functions like multi-level password security, fully indexed data base management, and modular integration.

### INTEGRATION

The nine independent application volumes or modules in this library can be linked together through the Librarian module to form a complete, unified system for business information management. Because data bases are shared among the various modules, the output data from one job can provide the inputs for another. This eliminates redundant data entry, speeds processing, and enables consistent operating procedures.

### FLEXIBILITY

Since each volume in the Business Library is an independent application module, this system can expand as your needs increase. For example, in the beginning, you could start with the General Ledger, Accounts Receivable, and Word Processor modules. Later, other modules could be integrated to upgrade the system to meet new business requirements. Moreover, this business software library can be used in a multi-company environment because the Librarian module automatically maintains separate records for each company's data, and each operator's access authorization.

### COMFORT

A good library should provide an environment that is conducive to relaxed, productive work. This is the philosophy that guided the overall design of the Business Library. All features have been arranged for easy access and use. All the programs are menu-driven; allowing the operator to move quickly from task to task. All tasks are initiated with standard function keys, and are guided by clear prompts. An extensive set of error messages identifies data-entry and system-operation mistakes and directs the operator in making corrections. An optional, self-instructional videotape training program introduces the operator to each module. A complete, fast-reference operator's guide for each module extends additional, ongoing

assistance as needed. If you already have, or are planning to install an IBM PC or XT, or other similar system, you will not find a more friendly atmosphere than the one offered by this library of thoughtfully designed programs.

### POWER

Gentle and fault-tolerant as this software is, there is no compromise to system performance. Each volume in this library excels in range of functions, and data manipulation techniques. Because the system is designed with a Data Base Manager structure, data retrieval is very fast and data storage conserves memory. But high performance also means powerful features like a Report Writer that generates customized report formats; and the Proffit Planner module that offers most of the business planning and forecasting capabilities of systems used in the largest, most complex business organizations.

### PLEASE . . .

If you are seriously considering a new software system for your business management needs, reserve a few minutes to familiarize yourself with this system. On the following pages you will discover a system that can be used as the benchmark for minicomputer power at microcomputer price. This remarkable library is open to your careful inspection. Software Libraries welcomes you to The Business Library.
